Legacy - Xcode Project Setup Guide

All of our client code is open source and available on GitHub.

Releases

We recommend integrating Alchemer Mobile using CocoaPods or Carthage. However you can also integrate Alchemer Mobile as a subproject of your app's project if you prefer not to use a package manager.

Download Source Code

You can clone our iOS SDK using git: `git clone https://github.com/apptentive/apptentive-ios.git` . You can also download source code from our releases page.

Add Alchemer Mobile as Xcode Subproject

Once you have downloaded the repository, add it as a subproject to your Xcode project or workspace. Drag the `Apptentive.xcodeproj` project file (located in the `Apptentive` folder of our source code) into your Xcode project.

Add Linker Flag

1. Select your Xcode project in the file navigator sidebar.

2. Select your project in the sidebar and switch to the "Build Settings" tab.

3. Search for the "Other Linker Flags" setting.

4. Double click the `Other Linker Flags` row's value area, on the right side. A pop-up should appear.

5. Add the `ObjC` linker flag by pressing the "+" button:

Add Alchemer Mobile Framework

1. Return to your Target's "Build Phases" tab.

2. Expand the "Target Dependencies" build phase.

3. Add `Apptentive.framework` as a target dependency.

4. Switch to your Target's "General" tab.

5. In the "Embedded Binaries" section, add `Apptentive.framework` .

Begin using Alchemer Mobile

Follow the steps here to begin using Alchemer Mobile.
