

Geo Charts

Alchemer Dashboard is currently waitlist only. [Visit this page](#) to learn more about Dashboard or join the waitlist!

Geo charts show data on a map by location. There are three geo charts that let you visualize geographical data in Alchemer Dashboard: [geo area](#), [geo bubble](#), and [geo heatmap](#) charts. These geo charts can display six types of geographical data, depending on territory:

- Country
- State
- County
- Zip code
- Point (latitude/longitude)
- Other sub-nation regions (for international countries)

Alchemer Dashboard now supports maps for all countries. See the complete list in [Openstreetmap supported countries](#).

Previously, Alchemer Dashboard supported the following geo chart capabilities:

- Visualize data at the country level for multiple countries in one chart.
- Visualize data at a higher level of detail (state, city, zip code) within one country at a time.

Now, Alchemer Dashboard supports the following capabilities:

- Visualizations comparing subdivisions of multiple countries in a single visualization. For example, if a selected column contains data from cities in the United States and Mexico, all data would be displayed on a single visualization.
- Visualizations displaying multiple levels of subdivisions within a country, rather than just city and zip code.
- Visualizations representing zip code as an area within a region, rather than a point on a map.

To improve the accuracy of your Search, we recommend appending the country name, or adding a reference to the country that the data is referring to. To append the country name, you can use a formula such as `concat (region, ', ' , country)`.

Displayed geo data

Here is a table that shows which GeoType data can be displayed using which geo chart type.

GeoType	Data Type	Geo chart type	Notes
Country	VARCHAR	Geo area (default), geo bubble, geo heatmap	Can also be regions.

GeoType	Data Type	Geo chart type	Notes
County	VARCHAR	Geo area (default), geo bubble, geo heatmap	Only for counties in the United States.
Latitude (point)	VARCHAR or DOUBLE	Geo bubble (default), geo heatmap	Must use both latitude and longitude columns.
Longitude (point)	VARCHAR or DOUBLE	Geo bubble (default), geo heatmap	Must use both latitude and longitude columns.
State	VARCHAR	Geo area (default), geo bubble, geo heatmap	Only for states in the United States.
Zip code	VARCHAR	Geo bubble (default), geo heatmap	Many different countries.
Other sub-nation regions	VARCHAR	Geo area (default), geo bubble, geo heatmap	The display depends on the type of administrative region.

For data to display in geo charts, your administrator must configure it as geographical data. If you don't get an expected map visualization, contact your administrator so they can configure the system correctly.

Geo chart customizations

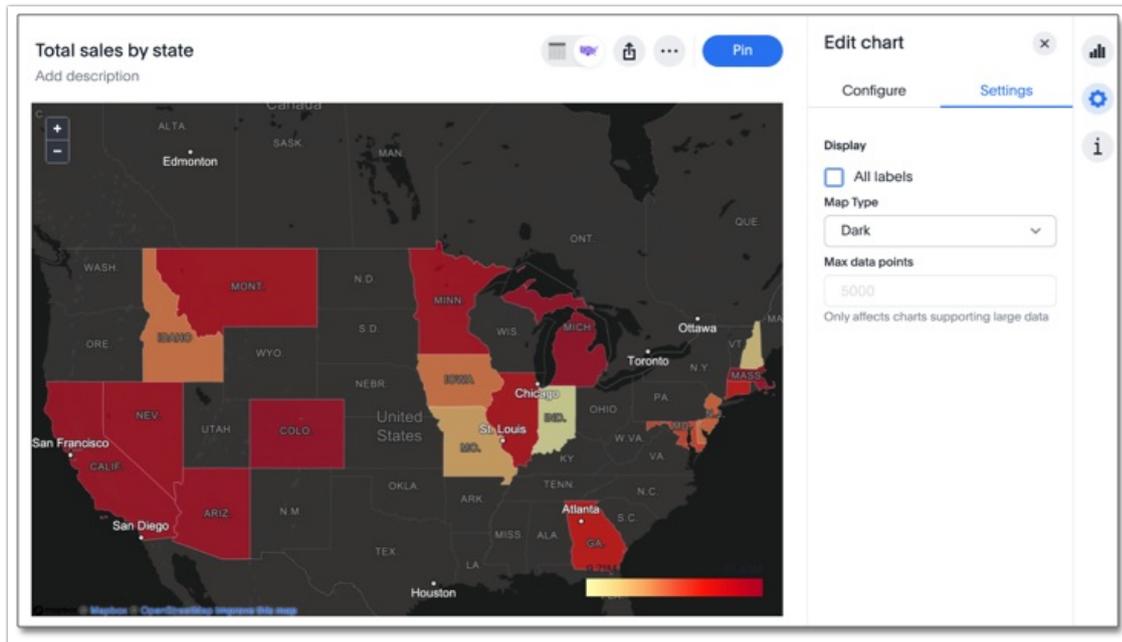

Geo charts allow you to customize the map display by changing the **Map type**.

To customize the **Map type**, follow these steps:

1. Navigate to any geo chart that you have **edit** privileges for.
2. Select the **chart configuration** icon on the left side of your screen.
3. Select **Settings** in the **Edit chart** panel.
4. Open the **Map type** dropdown menu, and select one of the options: Light, Dark, Outdoors, Streets, Satellite, or Satellite Streets. The default is **Light**.

For example, view the **Light** (default), **Outdoors** and **Dark** map types:

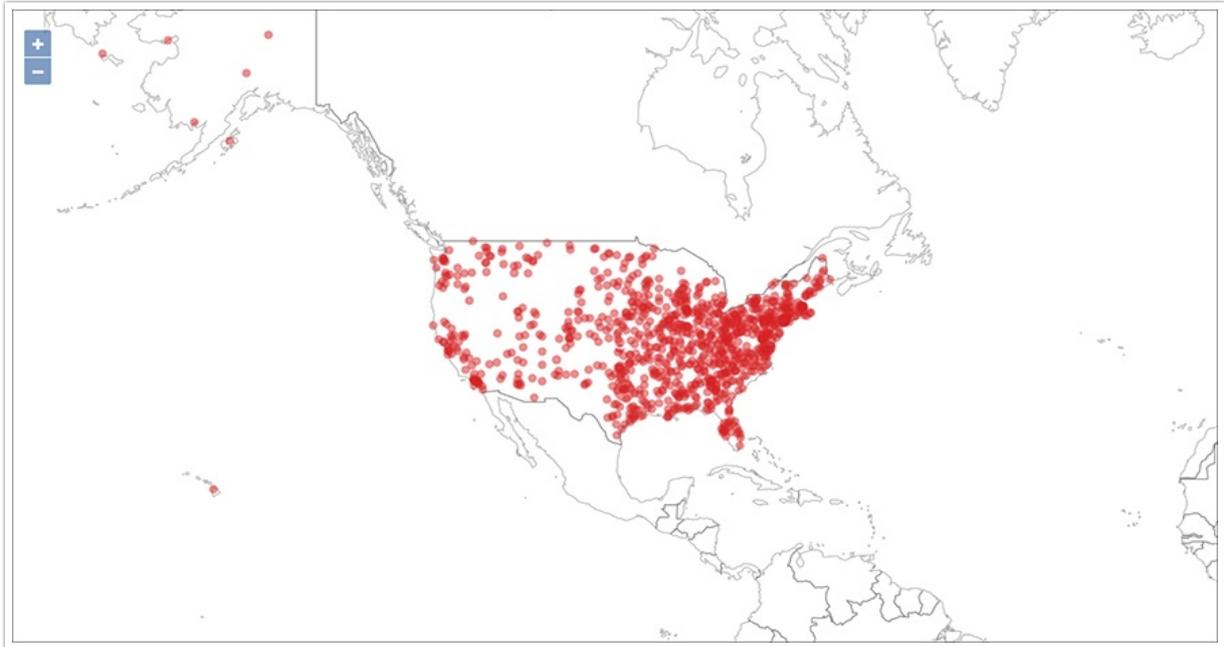

Limitations

Geo charts do *NOT* support conditional formatting.

Geo bubble charts

Geo bubble charts, like bubble charts, display the value of the measure through the relative size of the bubble. Zip code data is a good choice for geo bubble charts.

To paint a geo bubble chart, your search must include a geographical column, or a latitude and longitude pair.

Geo chart customizations

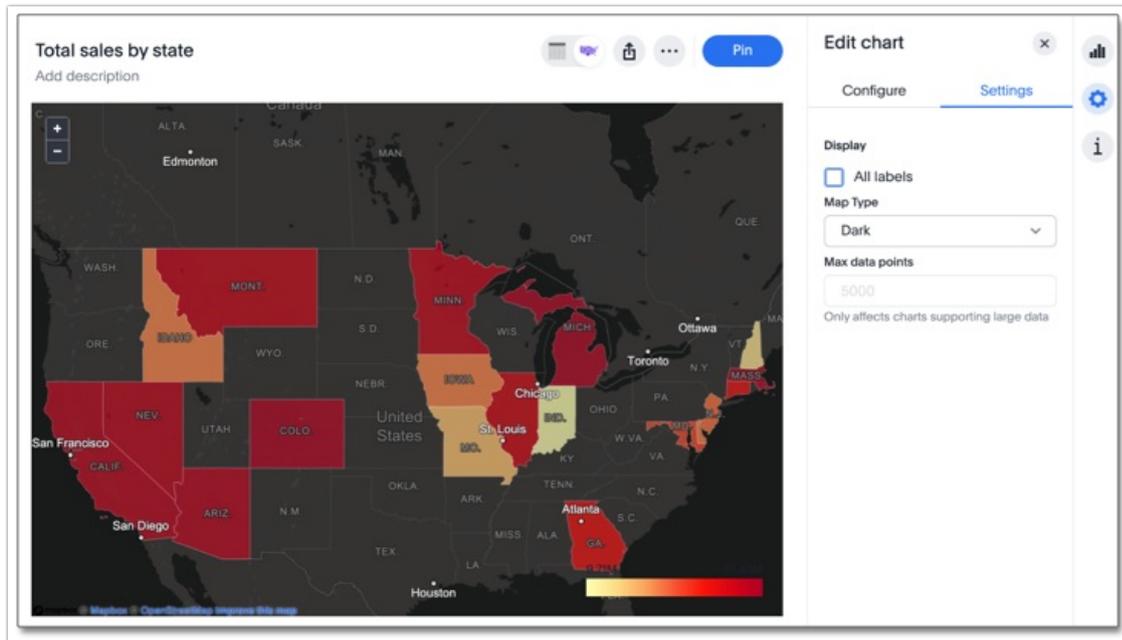

Geo charts allow you to customize the map display by changing the **Map type**.

To customize the **Map type**, follow these steps:

1. Navigate to any geo chart that you have **edit** privileges for.
2. Select the **chart configuration** icon on the left side of your screen.
3. Select **Settings** in the **Edit chart** panel.
4. Open the **Map type** dropdown menu, and select one of the options: Light, Dark, Outdoors, Streets, Satellite, or Satellite Streets. The default is **Light**.

For example, view the **Light** (default), **Outdoors** and **Dark** map types:

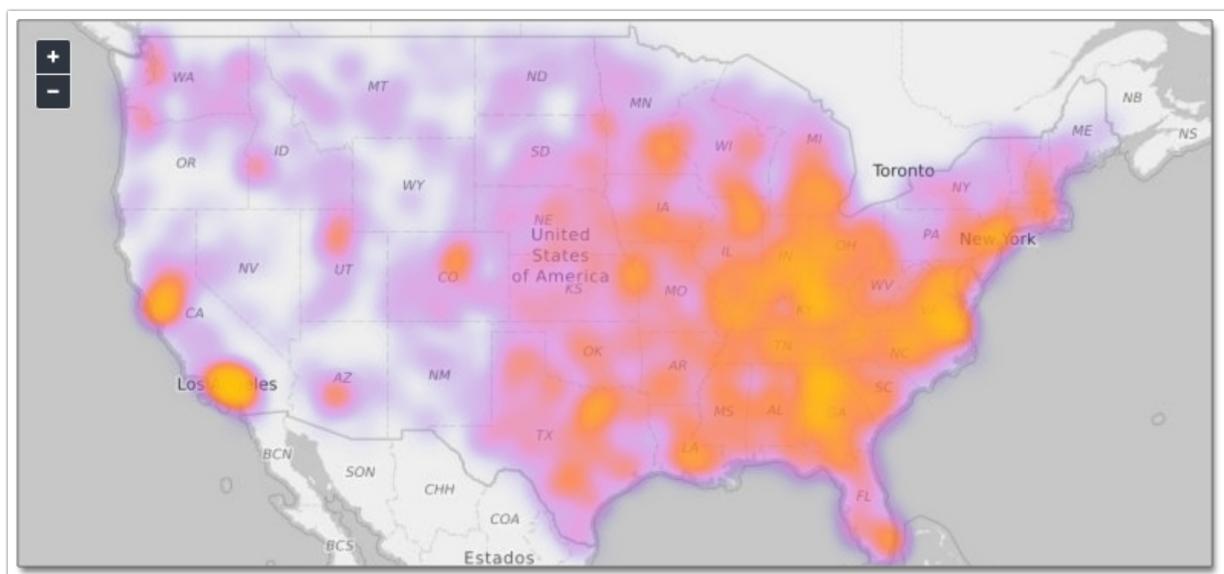

Limitations

Geo bubble charts do *NOT* support conditional formatting.

Geo heatmap charts

Geo heatmap charts display the value of the measure through the depth of color of the area. Use geo heatmap charts to see the relative value or density of a measure by location (for example, "sales" relative to "customer zip code").

To use the geo heatmap chart, your search must include a geographical column, or a longitude and latitude pair. Alchemer Dashboard supports geographical visualizations for many countries.

Geo chart customizations

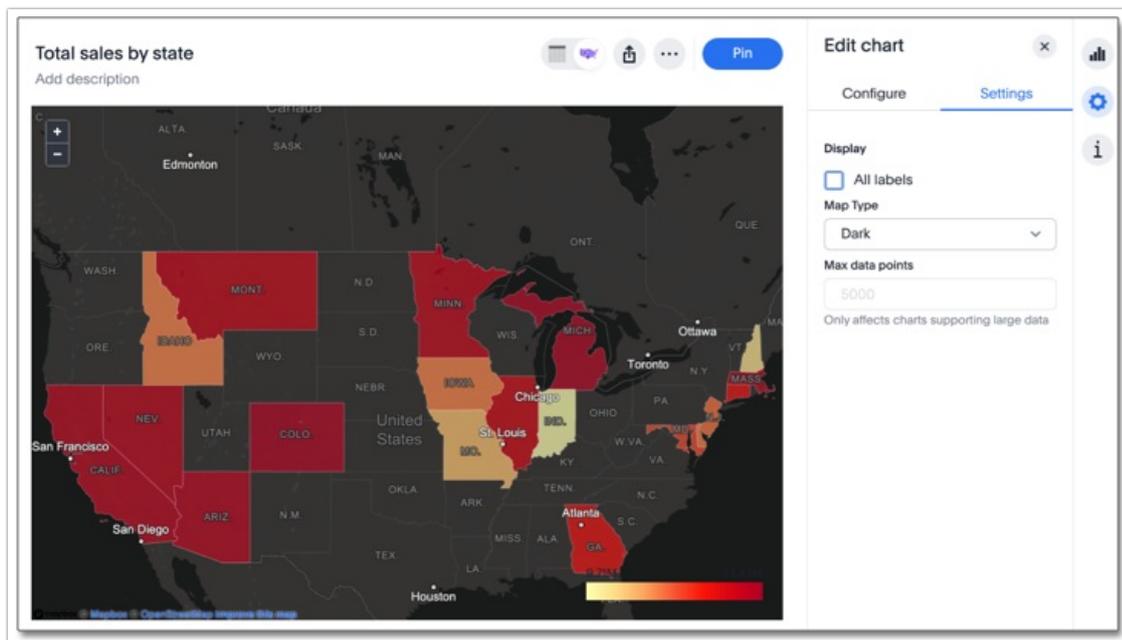

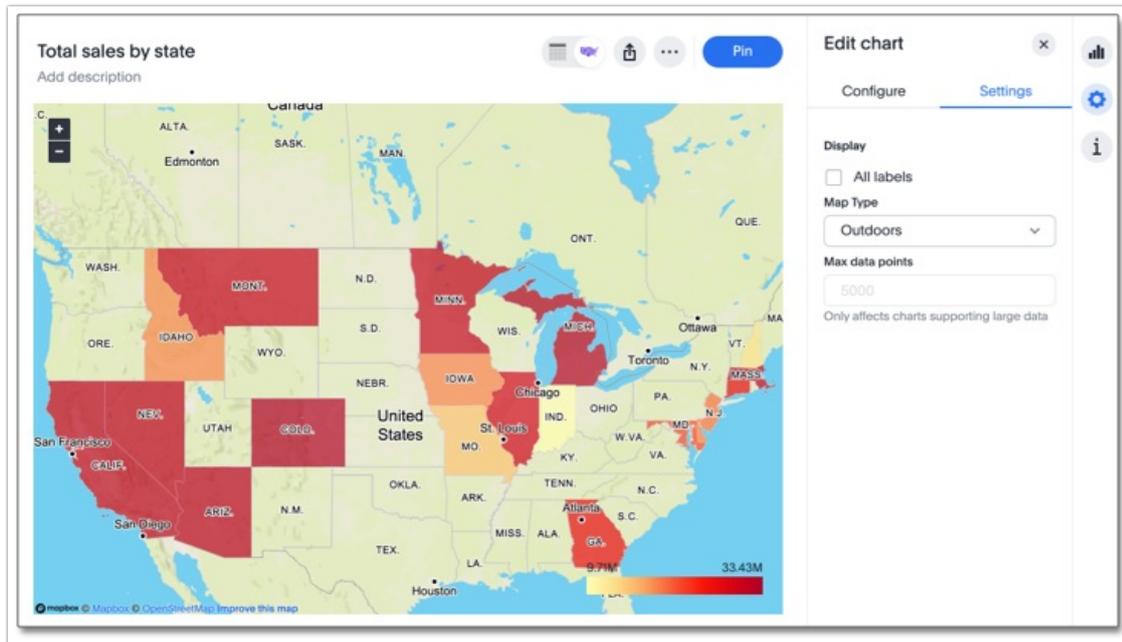

Geo charts allow you to customize the map display by changing the **Map type**.

To customize the **Map type**, follow these steps:

1. Navigate to any geo chart that you have **edit** privileges for.
2. Select the **chart configuration** icon on the left side of your screen.
3. Select **Settings** in the **Edit chart** panel.
4. Open the **Map type** dropdown menu, and select one of the options: Light, Dark, Outdoors, Streets, Satellite, or Satellite Streets. The default is **Light**.

For example, view the **Light** (default), **Outdoors** and **Dark** map types:

Change chart gradient

You can now choose multiple colors to define a gradient in charts that support gradients — geo heatmap, geo area, heatmap, and treemap charts. You can pin the low, mid, and high values, and numerical value points to customize the gradient.

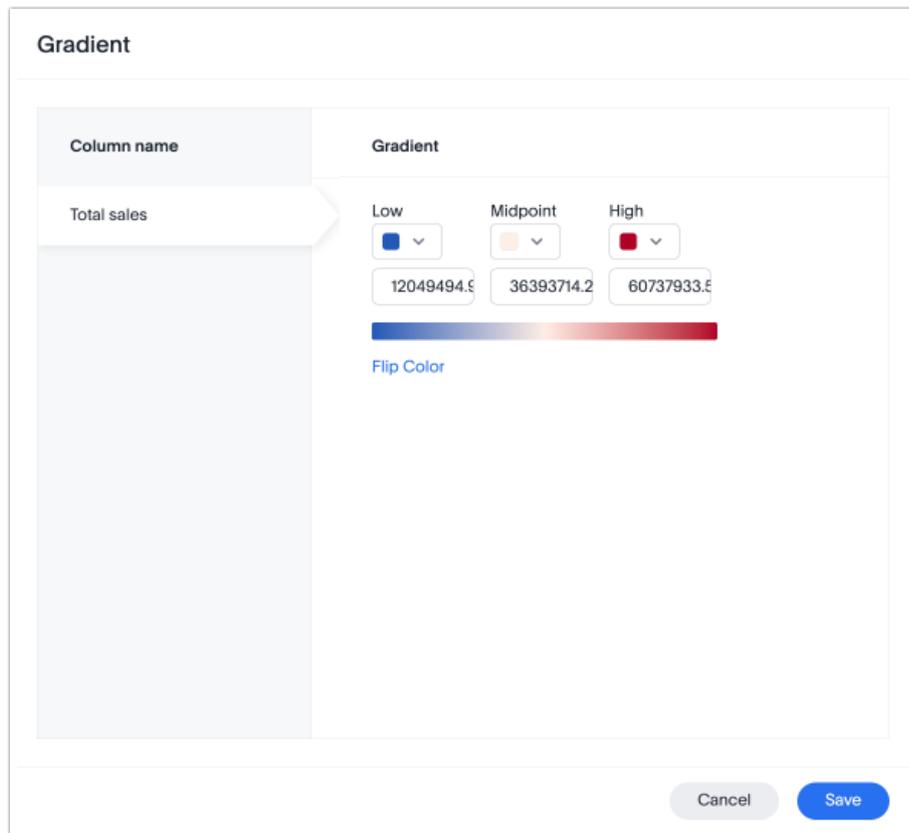

To define the gradient in a geo heatmap, geo area, heatmap, or treemap chart, follow these steps:

1. Open your chart, click the gear icon, and select the measure tile under **Value**. In a search by

sales, item type, and city, the value would be sales.

2. Select **Edit** under **Gradient**.

3. In the Gradient pop-up, define the colors for the **Low**, **Midpoint**, and **High** values using the color selector dropdowns.

The screenshot shows a 'Gradient' configuration dialog box. On the left, a list of columns is shown with 'Total sales' selected. The main area is titled 'Gradient' and contains three color selector dropdowns labeled 'Low', 'Midpoint', and 'High'. Below these are three text input fields with the values '12049494.£', '36393714.2', and '60737933.£' respectively. A horizontal gradient bar is displayed below the inputs, transitioning from blue on the left to red on the right. A 'Flip Color' link is positioned below the bar. At the bottom right, there are 'Cancel' and 'Save' buttons.

4. In the text boxes below the color selectors, you can define the low, midpoint, and high points numerically. You can define the low point, high point and midpoint as a narrow range if you would rather only see gradients for the top values of your measure.

5. (Optional) Select **Flip Color** to switch the high and low value colors.

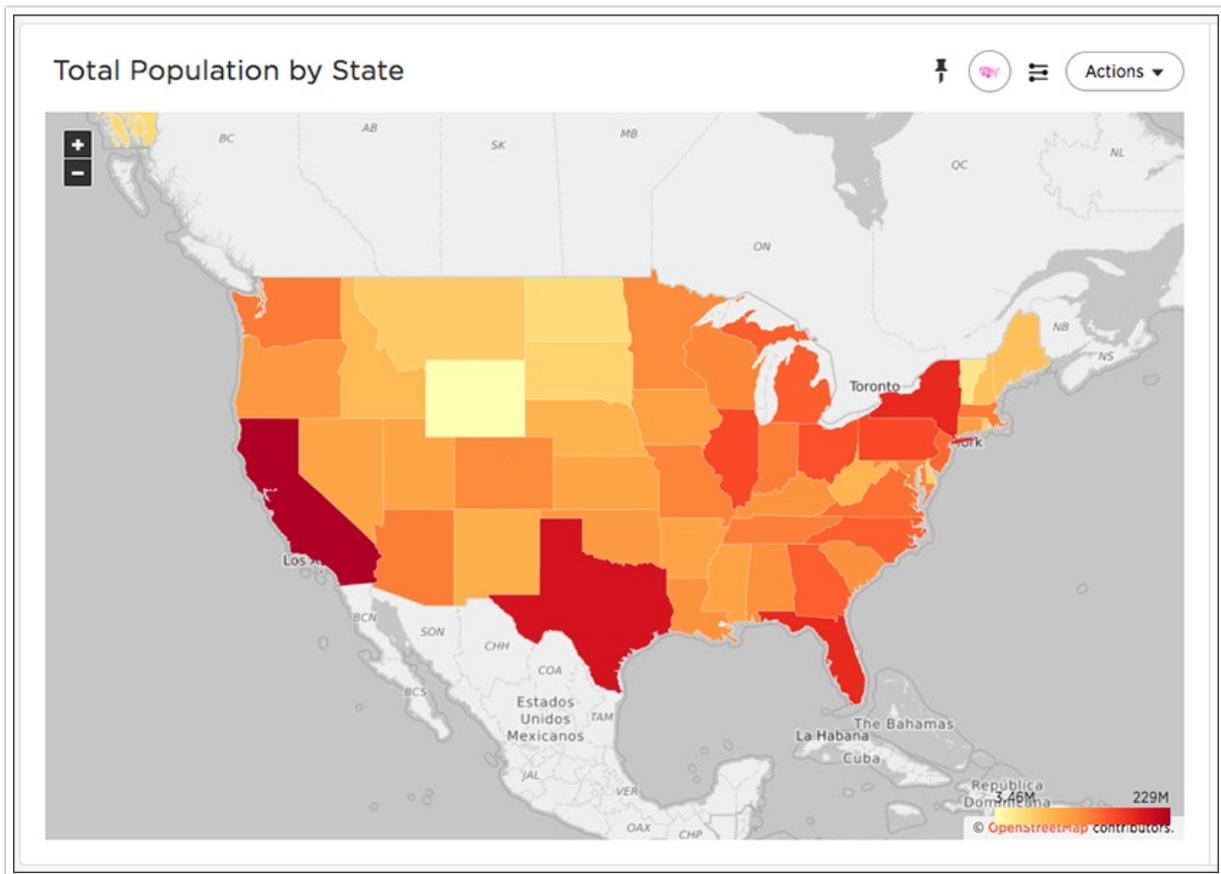

6. Select **Save**.

Limitations

Geo heatmap charts do **NOT** support conditional formatting.

Geo area charts

Geo area charts highlight the regions of interest, and display boundaries for various regions.

To paint a geo area chart, your search must include a geographical column with appropriate granularity. Note that you can create geo area charts using country, county, state, and other sub-division region data, but not with latitude, longitude, or zip code data.
