Show Data Labels
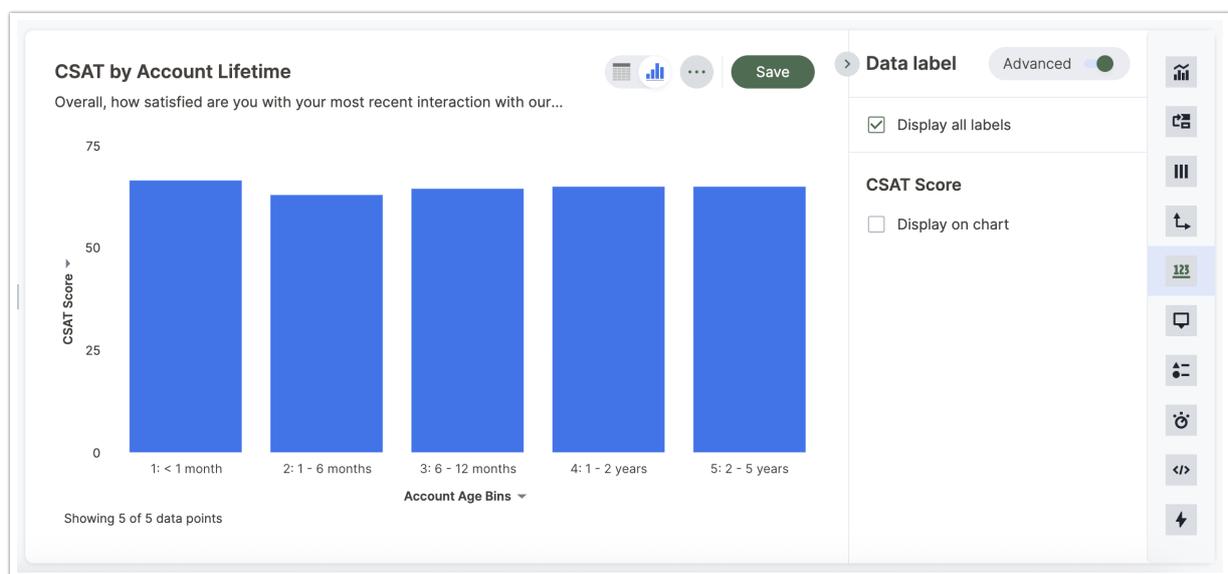

You can show data labels for every measure in your chart, or configure labels separately for each measure.

Configure all data labels

1. While viewing your search or Chart as a chart, select the Data Label icon in the chart builder menu.

2. Select the **All labels** checkbox.

To further configure the labels, by showing un-rounded numbers, for example, configure labels individually.

## Configure labels for one measure

1. While viewing your search or Chart as a chart, select the Data labels icon in the chart builder menu.

2. Select the measure you want to add labels to.

3. Select the **Data Labels** checkbox.

4. You can specify a **category**, like *number*, *percentage*, or *currency*. Otherwise, Alchemer Dashboard automatically picks the best category for your data.

5. When you specify a category, you can also specify **units**. Select *none* to see your data down to two decimal points, for example, or select *millions* to see labels rounded to the millions.

You can also specify the number of decimal places.
