

Alchemer Mobile 7.0 iOS SDK Release Notes

Please view our latest release notes below for Alchemer Mobile (ApptentiveKit) iOS SDK.

Version 7.0.0

Released February 26, 2026

This release delivers a modernized iOS SDK with support for Swift structured concurrency, a refreshed user interface aligned with iOS 26, and powerful new customization options that reduce the need for code-based styling.

Major changes

- **Minimum supported iOS version is now iOS 15**
Apps must target iOS 15 or later to use SDK version 7.0.
- **Public APIs are now Main Actor–isolated**
All public methods in the SDK are marked `@MainActor`. Apps using Swift concurrency must call SDK methods from the main actor or via a `Task`.
- **Region selection added during registration**
The SDK now supports selecting a data region at registration time:
 - United States (`.us` , default)
 - European Union (`.eu`)
 - Australia (`.au`)

Improvements and new features

- **Swift structured concurrency support**
 - Async/await alternatives are now available for all major SDK APIs
 - Methods that previously used completion handlers now support `async` or `async throws` patterns for a cleaner developer experience
- **Updated UI for iOS 26**
 - New default UI styling aligns with iOS 26's Liquid Glass design language
 - Earlier iOS versions continue using the legacy Apptentive theme for visual consistency

- **Asset Catalog–based UI customization (new)**
 - Customize colors and images using Asset Catalogs—no code required
 - Separate customization groups for Dialogs, Surveys, and Message Center
- **Global font configuration (new)**
 - Configure the font for all Alchemer Mobile UI elements with a single line of code
 - Reduces the need for per-component font overrides
- **Continued support for advanced customization**
 - UIKit extension properties remain available for granular overrides
 - Custom `InteractionPresenter` subclasses are supported for fully bespoke interaction experiences
