

# Alchemer Release Notes: February 2026

## Alchemer Product Release Notes

February 2026

---

### Release Highlights

- **More flexible Website Intercept targeting** with new URL rules like “contains” and “matches pattern (regex)”
  - **More consistent workflows**—“run once” actions now execute exactly as configured
  - **Enhanced required-question validation** for more complete responses
  - **Improved embedded question accuracy** for cleaner data collection
  - **More predictable Question Library publishing**, so updates behave as expected
- 

### Alchemer Survey

#### Enhanced required-question validation

We’ve strengthened how required questions are handled to support more complete response collection.

- Required questions are now validated at multiple levels for added consistency
- Additional safeguards help ensure required fields are completed as intended
- Limits added to support stable handling of repeated open-text inputs

You can collect more complete and reliable data with confidence.

---

#### Improved embedded question responses

Embedded questions (like those used in emails) now handle user interactions more consistently.

- Single-select questions now capture one clear answer per response, even during rapid interactions

Your data remains clear and consistent, even in fast-paced or high-volume scenarios.

---

### Website Intercept

#### More control over where intercepts appear

You now have more flexible ways to control when a Website Intercept displays on your site.

- New targeting options:
  - URL contains / does not contain
  - URL matches / does not match a pattern (regex)
- Works with full URLs, partial URLs, paths, and query parameters
- Improved support for managing multiple intercepts within a single setup

You can manage intercepts more efficiently and deliver the right survey experience on the right pages.

---

## Workflows (Alchemer Connect)

### More consistent scheduled delays

We've refined how time-based workflow steps are processed.

- When a delay reaches its scheduled time, all applicable workflow runs are triggered together

Your workflows execute in a more predictable and timely way, even at scale.

---

### Streamlined workflow setup experience

- Improved reliability when creating workflows with surveys attached
- Invite links now behave consistently across different workflow setups

You can build and launch workflows more smoothly, with confidence in how they'll perform.

---

### "Run once" actions execute as expected

- Actions configured to "run once" now consistently execute a single time, even during rapid navigation or refresh activity

Your integrations behave predictably, helping you maintain clean and controlled data flows.

---

## Question Library and survey builder

### More consistent publishing experience

We've improved how updates are managed and published in the Question Library.

- The "unpublished changes" message now appears consistently
- Publish prompts display at the right time after edits
- Updates can be published immediately without refreshing

You can confidently update and reuse questions, knowing your changes are applied as expected.

---

## API and integrations

### More flexible Teams API

- Teams DELETE endpoints now support JSON request bodies for user and team lists
- Query parameters remain supported and take priority when both are used

This gives you more flexibility when managing users and teams, especially in bulk or automated workflows.

---

### Platform reliability and performance

We've made several enhancements behind the scenes to support a fast and stable experience:

- Improved handling of high-volume data processing
- More consistent capture of client IP information
- Enhanced performance for background processes and administrative actions

These updates help ensure the platform continues to perform reliably as your programs scale.

---

## Regional and navigation updates

- **Survey Transfer** is now available in the Australian region
  - The **Dashboard** is now accessible from the main menu for all users
    - Users with access will see dashboards (Clarity)
    - Others will see an informational page
- 

## Fixes

This release also includes updates that improve overall consistency and usability across:

- Workflow setup and execution
  - Question Library publishing
  - Embedded question handling
  - Administrative tools
- 

## Best practices

To get the most out of these updates:

- **Website Intercept:** Use clear, simple URL rules and test when using multiple surveys
- **Embedded questions:** Consider adding a confirmation step or controlled submit behavior

- **Teams API:** Use request bodies for bulk updates; use query parameters for more targeted control
  - **Question Library:** Look for the “unpublished changes” message before publishing
- 

## About these release notes

This article covers the most important updates in this release. If you have questions or want help getting started, our [support team](#) is here for you.
