

Alchemer Release Notes: March 2026

Alchemer Product Release Notes

March 2026

Release Highlights

- Improved **Integration Factory Actions reliability**, especially for repeated pages and copied surveys
 - Safer **data imports** with better protection of repeated page data
 - Faster loading for **large workflows** in the Monitor tab
 - Enhanced **email compliance diagnostics** with improved logging
 - More flexible **Survey Transfer configuration** for admins
 - Fixes for **question library editing** and **export formatting**
-

Alchemer Survey

Improved Integration Factory Actions Reliability

Integration Factory Actions now behave consistently across repeated pages and copied surveys.

- Actions now trigger correctly for **each instance of a repeated page**, based on your configuration (e.g., once per response vs. every time)
- Copying a survey no longer links Integration Factory Actions between the original and the copy

These fixes restore expected behavior and improve reliability across survey configurations.

Safer Data Imports for Surveys with Repeated Pages

Data imports into surveys with multiple repeated page sets are now more reliable.

- Imports only update **mapped fields**
- Existing repeated data is preserved and no longer at risk of being unintentionally removed

This ensures safer bulk updates and better data integrity.

Improved Workflow Monitor Performance

The **Workflow Monitor** tab now loads more efficiently for workflows with very large run histories.

- The view prioritizes **recent runs**, improving load times and reliability
- Large workflows (hundreds of thousands of runs) can now be accessed without performance issues

Enhanced Email Compliance Logging

Additional debug logging has been added to CAN-SPAM approval processes.

- Provides better visibility into approval failures
- Helps teams troubleshoot and resolve issues more quickly

More Flexible Survey Transfer Configuration

Survey Transfer options can now be configured by region.

- Admins have more control over which transfer options are available
- Behavior is now more consistent and easier to manage across environments

Improved Question Library Editing

You can now successfully edit and save linked Question Library Page elements.

- Fix resolves an issue where edits could not be saved when a page was linked to the question library
- Improves usability when working with shared survey components

Improved Export Support for Multilingual Data

Image Heatmap exports now properly display CJK (Chinese, Japanese, Korean) characters in CSV files when opened in Microsoft applications.

This ensures exported data is readable and usable across global teams.
